3. Load the PDF file:

dart

Copy code

```
final file = File('path/to/your/file.pdf');  
final document = await PdfDocument.openFile(file.path);
```

4. Render the PDF page as an image:

dart

Copy code

```
final pageNumber = 1; // Replace with the page number you want to render  
final page = await document.getPage(pageNumber);  
  
final width = page.width;  
final height = page.height;  
  
final image = await page.render(width: width, height: height);  
  
final imageLib = ImageLib.Image.fromBytes(width, height, image.bytes);  
  
final pngImage = ImageLib.encodePng(imageLib);
```

5. Save the image to a file:

dart

Copy code

```
final imageFile = File('path/to/save/image.png');  
await imageFile.writeAsBytes(pngImage);
```

That's it! You should now have an image file of the first page of your PDF.
